Implementation and Time Analysis of Sorting Algorithms

Aim:

To implement and analyze the time complexity of Bubble sort, Selection sort, Insertion sort, Merge sort, and Quicksort.

Objective:

The objective of this practical is to implement and compare the performance of **Bubble Sort, Selection Sort, Insertion Sort, Merge Sort, and Quick Sort**. We will analyze the time complexity and execution time of each algorithm to understand their efficiency and identify the most suitable algorithm for different applications.

1. Bubble Sort

3. For $j = 0$ to $n - i - 2$
4. If $A[j] > A[j + 1]$
5. Swap $A[j]$ and $A[j + 1]$
6. End If
7. End For
8. End For
9. Stop

Code:

```
#include <iostream>
using namespace std;

void bubbleSort(int arr[], int n) {
    bool swapped;
    for (int i = 0; i < n - 1; i++) {
        swapped = false;
        for (int j = 0; j < n - i - 1; j++)
        {
            if (arr[j] > arr[j + 1]) {
                // Swap adjacent elements
                int temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
